PingFederate 2.0 – February 2005.....	24

Release Notes Introduction

PingFederate is the industry-leading solution for enabling secure single sign-on (SSO) to online services for employees, customers, and business partners. In addition, the PingFederate cloud identity platform provides cross-domain user provisioning and a WS-Trust Security Token Service (STS), which allows user access to identity-enabled Web Services. PingFederate also includes an OAuth 2.0 Authorization Server (AS), which allows secure API access.

Installation and Configuration

Refer to the Installation chapter of the PingFederate *Getting Started* manual.

About the 6.10.1 Release

This release addresses potential security vulnerabilities found since the PingFederate 6.10 release, including:

- Bundled OpenToken adapter updated to version 2.5.1
- RSA v1.5 deprecated for XML encryption
- Document clarification on usage of XML decryption and signing certificates

Major Enhancements for the 6.10 Release

For a condensed list of all enhancements for this and previous releases, see the [“Complete Change List by Released Version”](#) section, which also contains references to additional documentation.

Token Authorization

PingFederate now provides an optional configuration to evaluate attributes and other run-time variables for authorization purposes. This feature provides a way to extend access policy by conditionally allowing or disallowing the issuance of relevant security tokens for example, SAML assertion, STS tokens, OAuth access tokens, and session cookies. The Issuance Criteria configuration is available for all PingFederate flows, including:

- Browser SSO
- OAuth
- STS
- Attribute Query

Microsoft Office 365 Interoperability

PingFederate now provides full interoperability with Microsoft Office 365, including Exchange, Lync, SharePoint, and other Microsoft products.

OAuth Client Management API

PingFederate includes REST-based Web services for programmatic management of OAuth clients. The REST API is offered as an alternative to the OAuth client management functionality in the administrative console. The OAuth Client Management API allows you to create, retrieve, update, and delete OAuth clients. In addition, the OAuth Client Management in the administrative console has been enhanced to accommodate a large number of clients with search and pagination functionality.

OAuth Enhancements

The PingFederate OAuth Authorization Server has been enhanced with the following features:

- Compliance with OAuth 2.0 final specifications
- Optional expiration of OAuth persistent grants
- Multiple redirect URIs per client
- Optional restricted scope subsets per client
- Configurable consent page omission per client
- OAuth transaction events logged to audit log
- Mutual TLS authentication for OAuth clients

Centralized Active Directory Domain/Kerberos Realm Configuration

PingFederate now provides centralized Active Directory (AD) Domain and Kerberos Realm configuration for verifying authenticated users via adapters or token processors, including:

- PingFederate Integrated Windows Authentication (IWA) Integration Kit 3.0
- PingFederate Kerberos Token Translator 2.0

STS Token Exchange Mapping

PingFederate now provides the capability to translate WS-Trust security tokens directly from a configured Token Processor to a Token Generator without requiring the issuance of SAML tokens in a connection. Incoming security token attributes from the token processor are mapped directly to attributes in the issued security token from the appropriate token generator.

Splunk App for PingFederate

Splunk is widely-used enterprise software that allows for monitoring, reporting, and analyzing consolidated log files. Splunk captures and indexes real-time data into a single searchable repository from which reports, graphs, and other data-visualizations can be generated.

PingFederate now provides the Splunk App for PingFederate—a custom Splunk application developed by Ping Identity to process audit log files generated by a PingFederate deployment. The Splunk App for PingFederate provides rich system monitoring and reporting, including the following views:

- Current transaction and system reports
- Service reports such as a daily usage report and IdP and SP provider reports per connection
- Trend reports such as weekly and monthly usage reports and trend analysis

Other Enhancements

- Upgraded the Jetty Web container for PingFederate and removed the underlying JBoss infrastructure

Note: If you are upgrading PingFederate and rely on underlying JBoss components that have not been documented or supported by Ping Identity (such as the JBoss JMX Console), please note that the components may no longer be available.

- Added the ability to input multi-line OGNL expressions in the OGNL text field
- Enhanced PingFederate logging to include OAuth and STS transaction events in the security audit log
- Optimized PingFederate administrative console performance for deployments with numerous connections and adapter instances
- Improved LDAP connection pooling options for LDAP data stores
- Enhanced the PingFederate SDK

Known Issues

- Adapter instances specified as “Sufficient” in a Composite Adapter configuration should be limited to adapter types that explicitly return control to PingFederate after a failure. Otherwise, the next adapter instance in an authentication “chaining” sequence (if any) may not be tried, and other unexpected behavior may occur.

The following adapters work correctly under the Sufficient authentication policy in failure mode:

- X509
- LDAP (legacy adapter)
- OpenID - Generic
- OpenID - Google
- IWA – returns control to PingFederate only if the failure is the result of invalid credentials after the configured number of retries
- HTML Form
- HTTP Basic

Note: This list is updated as other adapters are modified, tested, and released.

- The anchored-certificate trust model cannot be used with the single logout (SLO) redirect binding since the certificate cannot be included with the logout request.

- PingFederate cannot simultaneously log the audit log to multiple databases and/or ArcSight CEF syslog. The audit log can only use a single log4j appender. See the `log4j.xml` file in `<pf_install/pingfederate/server/default/conf>` for additional details.
- When LDAP authentication is the configured administrative console authentication method, PingFederate does not lock out administrative users based upon the number of failed logon attempts. Responsibility for preventing access to the administrative console is, in this case, delegated to the LDAP server, and is enforced according to the password lockout policy settings maintained by that LDAP server.
- For a scenario involving SP-initiated SLO with multiple SPs in which the initiating SP is using a SOAP binding and the other SPs are using one of the front-channel bindings (Artifact, Redirect, or POST) along with a front-channel adapter within the IdP, logout with the front-channel adapter fails. When logout fails with the adapter (a technical limitation, since with SOAP-based SLO, the server does not have access to the browser to kill a session established with a front-channel adapter), any other IdP adapters that are configured for the connection, and for which logout needs to occur will not be invoked for logout. This includes back-channel (e.g., SOAP-based) adapters.
- Using the browser's navigation mechanisms (e.g., the **Back** button) causes inconsistent behavior in the administrative console. Use the navigation buttons provided at the bottom of screens in the PingFederate console.
- If authenticated to the PingFederate administrative console using certificate authentication, a session that has timed out may not appear to behave as expected. Normally (when using password authentication), when a session has timed out and a user attempts some action in the console, the browser is redirected to the login page and then to the Main Menu once authentication is complete. Similar behavior applies for certificate authentication, in principle. However, since the browser may automatically resubmit the certificate for authentication, what appears to happen is that the browser is redirected immediately to the Main Menu.
- If you have specified either an IdP or an SP connection that is configured to support only WS-Trust STS, the Browser SSO protocol is automatically set to SAML 2.0 even though the Browser SSO protocol is not used for STS-only connections. If you add Browser SSO support to this connection at a later time, the connection must use SAML 2.0.
- LDAP referrals return an error and cause provisioning to fail if the User or Group objects are defined at the DC level, and not within an OU or within the Users CN.

Note: The remaining items in this list concern limitations that apply to the use of the PingFederate configuration-migration scripting tool, `configcopy`.

- If you are using `configcopy` to copy all connections, channels, data sources, adapters, or token translators and you choose to set override properties, the override is applied to all instances. It is recommended that you use care when applying overrides for `copy-all` operations.
- The `configcopy` tool supports copying only a single reference for each of the following that are defined for a given connection: adapter, data source, Assertion Consumer Service URL, Single Logout Service URL, and Artifact Resolution Service URL. If you have multiple adapters, data stores, or any of the aforementioned service URLs associated with a given connection, only the first reference to each is copied.
- The `configcopy` tool does not support creation of configuration data that does not exist in the source. If you choose to set an override parameter for a parameter that does not exist in the source configuration, the behavior of the target system is not guaranteed.

- The configcopy tool, when used for copying plug-in configurations (including adapters, token translators, and custom data stores), does not currently support overrides of complex data structures, including tables, extended contract attributes, and masked fields.
- When upgrading to PingFederate 6.8, existing OAuth deployments using a MySQL database causes all existing persistent grants to expire. To address this issue, the `expires` column in the `pingfederate_access_grant` table should be nulled prior to the upgrade. If necessary, contact Ping Identity support for assistance.
- When an nShield Connect HSM in a HA nShield Connect cluster is shutdown, users will receive exceptions in the console when trying to create private keys for both digital signatures and SSL. Before creating new private keys, the nShield Connect HSM should be restored to a normal state (up on the network up, HSM up with OCS cards in their slots), and PingFederate should be restarted.
- PingFederate can enforce the masking of sensitive attribute values only within its own code base. External code such as adapter implementations and other product extensions may log attribute values in the clear even when they have been designated to be masked in the GUI. If sensitive attribute values are a concern when using such components, the logging level for the specific component can be adjusted in the `log4j.xml` file to the appropriate threshold to prevent attribute values from appearing in log files.
- When PingFederate is acting as a WS-Trust STS, if it receives a request on the STS endpoint with the namespace element set to an invalid value of `http://schemas.xmlsoap.org/ws/2005/02/trust/` (i.e., with a trailing slash), it does not normalize this to the valid namespace of `http://schemas.xmlsoap.org/ws/2005/02/trust` (i.e., without the trailing slash) and fails the transaction. In this case, the workaround is to have the client set the namespace element to the valid namespace of `http://schemas.xmlsoap.org/ws/2005/02/trust`.
- When using configcopy to copy connection data, any SOAP SLO endpoints defined in the source are not copied to the target, even if the SOAP SLO endpoint is the only SLO endpoint defined at the source. These must be manually added to the target.

Complete Change List by Released Version

PingFederate 6.10.1 – January 2013

- Replaced OpenToken adapter with version 2.5.1 to capture security enhancements.
- Other changes to address potential security vulnerabilities.

PingFederate 6.10 – September 2012

- Token Authorization (see *Administrator's Manual: About Token Authorization*).
- STS token exchange mapping (see *Administrator's Manual: STS Token Exchange Mapping*).
- OAuth client mutual TLS authentication (see *Administrator's Manual: Configuring a Client*).
- OAuth 2.0 final specification compliance.

PingFederate 6.9 – June 2012

- Microsoft Office 365 interoperability.
- STS transaction events logged to audit log (see *Administrator's Manual: System Administration*).
- Upgraded Jetty and removed underlying JBoss infrastructure.

PingFederate 6.8 – April 2012

- Added centralized AD Domain/Kerberos Realm configuration (see *Administrator's Manual: Security Management*).
- Added OAuth Client Management REST API (see *Administrator's Manual: Web Service Interfaces*).
- Added optional expiration of OAuth persistent grants (see *Administrator's Manual: OAuth Configuration*).
- Added multiple redirect URIs per OAuth client (see *Administrator's Manual: OAuth Configuration*).
- Added optional restricted scope subsets per OAuth client (see *Administrator's Manual: OAuth Configuration*).
- Added configurable consent page omission per OAuth client (see *Administrator's Manual: OAuth Configuration*).
- Added OAuth transaction events logged to audit log (see *Administrator's Manual: System Administration*).

PingFederate 6.7 – February 2012

- Added Splunk Application for PingFederate (see *Administrator's Manual: System Administration*).
- Improved administrative console navigation and save performance.
- Added LDAP connection pooling options for LDAP datastores (see *Administrator's Manual: System Settings*).

PingFederate 6.6 – December 2011

- Added contextual IdP Adapter selection using Adapter Selectors (see *Administrator's Manual: Key Concepts*).
- Added ability to chain multiple IdP adapters together using the Composite Adapter (see *Administrator's Manual: Key Concepts*).
- Added the ability to use multiple IdP datastores for attribute retrieval and mapping into an IdP attribute contract (see *Administrator's Manual: Key Concepts*).
- Added an HTML Form adapter and HTTP Basic adapter to replace the LDAP Authentication adapter (see *Administrator's Manual: Key Concepts*).
- Support for the OAuth SAML 2.0 Bearer Assertion Grant Type (see *Administrator's Manual: OAuth Configuration*).
- Added an Admin Console Help system updater (see *Administrator's Manual: System Settings*).

- Added IPv6 support.

PingFederate 6.5.2 – November 2011

Security update since the PingFederate 6.5.1 release.

PingFederate 6.5.1 – October 2011

Security updates since the PingFederate 6.5 release.

PingFederate 6.5 – August 2011

Note: The PingFederate 6.5 release includes the features described below as well features that were added in a limited-distribution “Preview” release, described in the next section.

- PingFederate now functions as an OAuth 2.0 Authorization Server (see *Administrator’s Manual: OAuth Configuration*).
- Added support for Thales (nCipher) nShield Connect HSM (see *Getting Started: Using the Thales nShield Connect HSM*).
- Account Linking can use an LDAP directory for a persistent data store in addition to a relational database system (see *Administrator’s Manual: System Settings*).
- User-Defined Attribute Namespaces can be specified for Browser SSO protocols (similar to what was added to WS-Trust STS) to allow for better Microsoft interoperability (see *Administrator’s Manual: Key Concepts*).
- Adapter to Adapter mapping now counts as a licensed connection (see *Administrator’s Manual: System Settings*).
- LDAP Adapter updated to 2.2 with new default Web form login template (see *Administrator’s Manual: LDAP Adapter Configuration*).
- Jetty version upgrade from 6.1.7 to 6.1.26.

PingFederate 6.5-Preview – April 2011

- Full STS metadata Claims Provider and Relying Party interoperability with Microsoft WIF, WCF, and ADFS 2.0.
- Support multiple token-processor instances of the same token type (see *Administrator’s Manual: IdP Configuration for STS*).
- Added SAML HoK subject confirmation in the SAML Token Generator (see *Administrator’s Manual: SP Configuration for STS*).
- Added option for STS SAML token KeyInfo to use a signing certificate reference rather than the full signing certificate (see *Administrator’s Manual: IdP Configuration for STS*).
- Session-state modifications to support simultaneous and nested SSO transactions.

- IdP adapter session handling for IdP adapters that rely on PingFederate for session management to allow for consecutive requests without prompting for credentials.

PingFederate 6.4.1 – February 2011

- Corrected license expiration date calculation. In some cases, the PingFederate server would stop processing transactions prior to the license expiration date.

PingFederate 6.4 – December 2010

- Support standard .NET WS-Trust Federation Bindings (see *Administrator's Manual: Key Concepts*).
- Support SAML 2.0 token Holder of Key (HoK) subject confirmation (see *Administrator's Manual: WS-Trust STS Configuration*).
- Added Metadata Exchange (MEX) endpoint for WIF client to generate bindings automatically for Username, X.509, and SAML tokens (see *Administrator's Manual: Application Endpoints*).
- Added support for WS-Trust 1.4 ActAs property.
- Added two-factor authentication capability with the VeriSign® Identity Protection (VIP) Authentication Service Adapter (see *Administrator's Manual: Identity Provider SSO Configuration*).
- OpenToken Adapter 2.4.1 updated to correct issue with Cookie Transport Method and Replay Prevention.
- Expanded digital signature secure hash algorithm types - SHA1, SHA256, SHA 384, and SHA512 (see *Administrator's Manual: sections covering applicable certificate-selection screens*).
- The provisioning log can be written to a database. Oracle, Microsoft SQL Server, and MySQL databases are supported (see *Administrator's Manual: System Administration*).
- Added SAML protocol support for AuthnContextDeclRefs (see *Administrator's Manual: Application Endpoints*).

PingFederate 6.3 – August 2010

Note: The PingFederate 6.3 release includes the features described below as well features that were added in a limited-distribution “Preview” release, described in the next section.

- PingFederate STS claims-based identity capabilities extended to support interoperability with Microsoft WIF and WCF client frameworks (see *Administrator's Manual: Key Concepts*).
- Expanded SNMP monitoring variables available in the management information base (MIB) (see *Administrator's Manual: System Settings*).
- Increase the default PingFederate HTTP header buffer size to 8k.
- Key stores and key store passwords are dynamically generated per installation.
- The default SSL server certificate is generated upon initial startup if an SSL certificate does not exist.
- LDAPS trust configuration no longer requires a server restart to take effect.

PingFederate 6.3-Preview – April 2010

- Added support for logging to the ArcSight Common Event Format (CEF) (see *Administrator's Manual: System Administration*).
- Added ability to log to a database with failover to file. Oracle, SQL Server, and MySQL databases are supported (see *Administrator's Manual: System Administration*).
- Added ability to disable automatic multi-connection validation if the validation time is causing excessive delay (see *Administrator's Manual: System Settings*). Connection validation can then be controlled manually per connection.
- Extended JDBC Express Provisioning to support MS SQL Server stored procedures (see *Administrator's Manual: Service Provider SSO Configuration*).
- Added replay prevention capability to the OpenToken IdP Adapter bundled with PingFederate.

PingFederate 6.2 – February 2010

- Added IdP-to-SP adapter mapping, which allows user attributes from an IdP adapter to be directly mapped to an SP adapter on the same PingFederate server to create an authenticated session or security context, without the need to generate SAML messages in between (see *Administrator's Manual: System Settings*).
- Provides enhanced logging capabilities including a new audit log, logfilter utility, and ability to log to any accessible file-server directory (see *Administrator's Manual: System Administration*).
- Provides enhanced support for configuration automation including certificate and key management, configuration archive management, and ancillary deployment files (see *Administrator's Manual: System Administration*).
- Extended JDBC Express Provisioning to support MS SQL Server Identity column types (see *Administrator's Manual: Service Provider SSO Configuration*).
- Added a Logout Endpoint to the LDAP Authentication Adapter (see *Administrator's Manual: LDAP Adapter Configuration*).
- In clustered mode, the default Inter-Request State Management methodology is now group RPC-based instead of cookie-based (see the Server Clustering Guide).
- Added ability to extract CN from DN and extract username from email address for provisioner attributes (see *Administrator's Manual: Identity Provider SSO Configuration*).
- In Luna HSM mode, added the ability to specify the location to store Trusted CA certificates, either in the Sun Java key store or the Luna HSM (see the configuration file `org.sourceid.config.CoreConfig.xml` in the `pingfederate/data/config-store` directory).

PingFederate 6.1 – September 2009

Note: The PingFederate 6.1 release includes the features described below as well features that were added in a limited-distribution “Preview” release, described in the next section.

- Provides support for simplified PingFederate Express connection configuration and export (see *Administrator's Manual: Identity Provider SSO Configuration*).
- Extends support for configuration automation, including listing, copying, and updating features for SaaS Provisioning channels and for Token Translators (see *Administrator's Manual: System Administration*).
- Provides enhanced support for SaaS Provisioning Health and Status Monitoring via JMX (see *Administrator's Manual: System Settings*).
- Provides licensing enhancements including support for organizational licenses, licenses that contain international characters, and Web based license import (see *Administrator's Manual: System Administration*).
- Enhances the trust model to include support for anchored certificates, which allows certificates to be included in federation-transaction messaging and used for signature verification if, the given certificate matches the registered Subject DN and is issued by a certificate authority registered as a Trusted CA with PingFederate (see *Administrator's Manual: Key Concepts*).
- Supports “SP Lite”, “IdP Lite”, and “e-Gov” Liberty Interoperability profiles for SAML 2.0.

PingFederate 6.1-Preview – June 2009

- Provides support for Express Provisioning to a JDBC data source (see *Administrator's Manual: Service Provider SSO Configuration*).
- Extends support for configuration automation, including listing, copy and update features for data stores and server settings (see *Administrator's Manual: System Administration*).
- Supports certificate-based authentication to the PingFederate administrative console (see *Administrator's Manual: System Administration*).
- Added UI-based data-archive deployment, as well as better error handling for common errors encountered (see *Administrator's Manual: System Administration*).
- Supports mapping of attributes passed in via a WS-Trust STS request to the outgoing token (see *Administrator's Manual: WS-Trust STS Configuration*).
- Supports logging of a transaction ID associated with every log entry for a given request to the PingFederate server.
- Corrects defects reported by customers in the previous release.

PingFederate 6.0 – March 2009

- PingFederate now includes a WS-Trust Security Token Service (STS), enabling organizations to extend identity management to Web Services. The PingFederate STS shares the core functionality of PingFederate, including console administration, identity and attribute mapping, and certificate security management (see *Getting Started: WS-Trust STS Configuration*).
- PingFederate extends support for configuration automation, including connection management and adapter management via the existing command-line tool (see *Getting Started: Installation*).
- PingFederate supports enhanced connection based licensing capabilities.

- PingFederate provides transaction based licensing capabilities for evaluation phase license enforcement.
- PingFederate allows administrators to specify the use of a separate certificate that is used for access to the administrative console and a different certificate for runtime processing. (see *Administrator's Manual: System Settings*).
- PingFederate supports configuration of LDAP Groups who are allowed access to the PingFederate Admin application based on PingFederate defined roles (see *Administrator's Manual: System Administration*).
- PingFederate supports definition of LDAP data stores such that the connection URI for multiple LDAP servers can be specified as the connection string for that LDAP data store (see *Administrator's Manual: System Settings*).
- PingFederate supports the Virtual List View (VLV) paging mechanism for retrieval of subsets of large result sets returned from the source LDAP data store during the provisioning process. This can significantly enhance performance for retrieval of data from Sun Directory Server (SDS) and similar LDAP servers that support VLV paging.
- PingFederate now stores the PingFederate software version within the configuration store.
- A number of defects reported by customers that existed in the previous release of PingFederate were addressed.

PingFederate 5.3 – December 2008

- PingFederate can be run as a service on Windows 64-bit platforms in addition to Windows 32-bit platforms and Linux platforms (see *Getting Started: Installation*).
- PingFederate now supports deployment of SaaS Provisioning plug-ins (JAR files) via a separate installation package (documented in Connector packages).
- PingFederate now supports automating configuration via a command line utility for connection management (see *Administrator's Manual: System Administration*).
- PingFederate now supports capabilities for monitoring and control of the SaaS Provisioning configuration and data via a command line tool (see *Administrator's Manual: System Administration*).
- PingFederate now supports validation of certificate revocation information via OCSP (see *Administrator's Manual: System Settings*).
- PingFederate can now be deployed on Java 6 (JDK 1.6) platforms.
- PingFederate supports access to additional parameters on both the IdP side and the SP side via OGNL expressions (see *Administrator's Manual: Identity Provider SSO Configuration and Service Provider SSO Configuration*).
- PingFederate supports “SP Lite” and “IdP Lite” Liberty Interoperability profiles for SAML 2.0.
- PingFederate supports configuration of the name, domain, and path for the cookie used for conveying state information between servers when cookie-based clustering has been configured.
- A number of past Known Issues and Limitations were addressed.

PingFederate 5.2 – August 2008

- A PingFederate IdP server now provides support for provisioning to selected SaaS providers. PingFederate supports provisioning of user account data from LDAP directories including Active Directory and Sun Directory Server. PingFederate stores synchronization data in JDBC data stores including Hypersonic (for demonstration purposes) and Oracle.
- PingFederate supports quick-connection templates to selected SaaS Providers, including Google Apps, and Salesforce.com

PingFederate 5.1.1 – July 2008

This release corrected several issues, including:

- SP signature verification was failing for assertions containing UTF-8 characters.
- In Windows the PingFederate server was unable to start when the JAVA_HOME system variable contained a space.
- Versions of the OpenToken library were placed in the wrong directory.
- Single Logout (SLO) with two SPs was not being performed for the IdP session(s).
- For SLO with three or more SPs, SP sessions were being stranded.
- Specific to PingFederate 5.1, Custom Data Sources no longer could be used for Adapter Contract fulfillment.
- When testing certain types of OGNL expressions, important error details were being lost when evaluation of these expressions failed.
- For SLO with at least two SPs, under certain circumstances error messages from SPs that did not initiate the SLO were not being processed correctly by the IdP.
- A PingFederate SP instance, when used with the OpenToken adapter, was converting a plus “+” character to a space “ ” when constructing the URL for final redirect.
- Signature validation was failing within a PingFederate SP instance when it received an SLO message in which the SAML_SUBJECT was being encrypted.
- PingFederate 5.1 SP instance was no longer supported SiteMinder SSO Zones.

PingFederate 5.1 – April 2008

- The default behavior when PingFederate cannot access a Certificate Revocation List (CRL) is now set correctly. The server no longer treats a non-retrievable CRL as a reason to label certificates as revoked. CRL processing behavior is managed by the revocation-checking-config.xml file in the `/pingfederate/server/default/data/config-store` directory.
- The IP address to which PingFederate’s SNMP agent binds is now controlled by the `pf.monitor.bind.address` property in the `run.properties` file (*Administrator’s Manual: System Administration*).
- Building either of the two example adapters included in the PingFederate SDK no longer fails with an error regarding a missing README.txt.

- The PingFederate server now correctly maintains temporary files within the `/pingfederate/server/default/tmp` directory. The server no longer writes temporary files to the `tmp` directory of the user running the server.
- Express Provisioning allows user accounts to be created in an LDAP repository and updated directly by an SP PingFederate. User provisioning occurs as part of SSO processing and may be used with any IdP partner (*Administrator's Manual: Managing IdP Connections*).
- The Signature Policy screen in SAML IdP connections contains improved language clarifying how signatures are used to guarantee authenticity of SAML messages (*Administrator's Manual: Managing IdP Connections*).
- The PingFederate package now contains v6.1.7 of Jetty. Jetty is the servlet container used by PingFederate.
- The PingFederate SDK contains a `ConfigurationListener` interface that may be utilized by developers building adapters. This interface contains methods invoked by the server in response to certain adapter-instance lifecycle events such as creation and deletion.
- Adapter-instance Summary screens now display adapter-instance configuration values specified within a `TableDescriptor`.
- After the third consecutive failed login attempt, an administrator is blocked from accessing the administrative console for a configurable amount of time (default = 60 seconds).
- When changing an administrator password, the server now forces the new password to differ from the existing password (*Administrator's Manual: System Administration*).
- Access to services exposed by the PingFederate server now requires client authentication. These services include Attribute Query, JMX, and Connection Management. An administrator may choose to require client authentication for access to the SSO Directory Service. An ID and Shared Secret comprise the credentials needed for authentication (*Administrator's Manual: Security Management*; *Administrator's Manual: Web Service Interfaces*).
- For security, the use of "Expression" in contract fulfillment screens is now disallowed by default. For backward compatibility, customers deploying a configuration archive from a previous version of PingFederate in which expressions were used will continue to have access to expressions. Allowing expressions creates a potential security concern in the PingFederate administrative console. (*Administrator's Manual: Using Attribute Mapping Expressions*)
- The Quick-Start SP Application no longer uses an OGNL expression in fulfilling the SP adapter contract.
- HTTP TRACE requests sent to PingFederate now result in an HTTP 403 Forbidden response.
- By default, "weak" ciphers are no longer supported during SSL handshaking. (For more information as to which cipher suites the server supports, examine the `com.pingidentity.crypto.SunJCEManager.xml` file in `pingfederate/server/default/data/config-store`.)
- It is no longer possible for an administrator to circumvent role and access permissions within the administrative console by direct URL access. The server evaluates HTTP requests for a URL against an administrator's assigned role(s) and responds appropriately.

- The PingFederate runtime server's HTTP listener is now turned off by default. Only messages sent over HTTPS are accepted. This may be controlled in the run.properties file in the pingfederate/bin/directory.
- Use of class and package names specific to a PingFederate version were removed from sample source code contained in the PingFederate SDK.
- The /idp/startSSO.ping endpoint now supports an optional ACSIdx query parameter for SAML v2 partners. When provided, the PingFederate IdP attempts to send the SAML Assertion to the Assertion Consumer Service corresponding to the specified Index (*Administrator's Manual: Application Endpoints*).
- The initial and maximum JVM heap sizes are set to 256 MB and 1024 MB, respectively, by default. These changes should improve runtime performance on servers with sufficient memory. These settings reside in the run.bat and run.sh files of the pingfederate/bin/directory.
- During server startup, PingFederate now reports relevant environment variables and adapter-instance information to the server.log.
- Existing partner connections can be deleted through a SOAP call from an external client application. (*Administrator's Manual: Web Service Interfaces*).
- The pf-legacy-runtime.war file is no longer deployed by default. This WAR file allows a PingFederate server to continue support of legacy endpoints (those endpoints supported by PingFederate 2). When replacing an existing PingFederate 2 server deployment, manually move this WAR to the pingfederate/server/default/deploy/directory.
- The PingFederate server can be configured to support the use of a proxy server when retrieving a CRL from a Certificate Authority. Relevant configuration settings reside in pingfederate/server/default/data/config-store/revocation-checking-config.xml.
- When the PingFederate server relies upon an external LDAP directory to authenticate administrative users, the ldap.password property in the pingfederate/bin/ldap.properties file now supports encrypted credentials (*Getting Started: Installation*).
- The PingFederate server allows imported SSL server certificates containing signatures from one or more intermediate Certificate Authorities. When SSL clients request an SSL connection to the PingFederate server, the entire SSL server certificate chain is presented.
- The Summary and Activation screens for both IdP and SP connections display a valid URL that serves as an example of a startSSO.ping endpoint used by local applications integrating with PingFederate (*Administrator's Manual: Managing SP Connections and Managing IdP Connections*).
- The Web SSO entry screens for both IdP and SP connections include summary information in a table describing relevant configuration settings (*Administrator's Manual: Managing SP Connections and Managing IdP Connections*).
- The PingFederate server prevents auditors from accessing links on the Main Menu that impact external resources. This includes exporting SAML metadata, signing XML files, and creating configuration archives (*Administrator's Manual: System Administration*).

PingFederate 5.0.2 – March 2008

- IdP Persistent Reference Cookie (IPRC) — Provides a mechanism allowing an SP PingFederate server to discover a user's IdP based on a persistent browser cookie that contains a reference to the IdP partner previously used for SSO.

This feature provides an alternative to standard IdP Discovery for SP-initiated SSO, as defined in the SAML specifications, which uses a common-domain cookie (CDC) written by the IdP (see the *PingFederate Administrator's Manual*). Unlike the IdP Discovery cookie, the IPRC is written by the SP PingFederate each time an SSO event for the user occurs (either IdP- or SP-initiated). The cookie identifies the IdP partner using information in the SAML assertion. For subsequent SP-initiated SSO requests, the SP server can skip a previously required step prompting the user to select an IdP for authentication when multiple IdP partners are configured but none is specifically identified in the SSO call received by the SP PingFederate server.

- Updated the IdP-selection template to make it easier to use. The new selection template is used when no IPRC (or CDC) is available and when there are multiple IdPs to which the user might have previously authenticated.
- Corrected an issue in which a Concurrent Modification Exception was encountered when server clustering is used and debug is turned on for log files. (The workaround for this issue in previous releases is to turn debug off.)
- When no certificate revocation list (CRL) is found during certificate validation checking, the subject certificate is assumed to be valid for the current SSO/SLO transaction. Previously, when no CRL was found, the certificate was deemed invalid and the transaction aborted. The default setting is changed for this release to prevent problems with upgrading to PingFederate 5.x from previous versions.

PingFederate 5.0.1 – January 2008

- Support for rapid provisioning of partner connections is available using Auto-Connect technology. Leveraging the existing SAML 2.0 specification, Auto-Connect allows PingFederate deployments to scale easily with minimal manual involvement. The majority of partner connection configuration occurs at runtime through the exchange of dynamically generated metadata (*Administrator's Manual: Managing SP Connections and Managing IdP Connections*).
- Administrators can authenticate to the administrative console using credentials in an external LDAP directory. This allows organizations with existing admin accounts to provide access to the console without creating and managing individual accounts within PingFederate (*Getting Started: Installation*).
- Partner connections may be created by importing them programmatically into PingFederate through a SOAP interface. This allows administrators to provision partner connections without accessing the administrative console manually. The Connection Management screens (both IdP and SP) contain an "Export" action that creates an XML file containing a connection's configuration (*Administrator's Manual: Web Service Interfaces*).
- Server configuration data may be replicated to a cluster through a SOAP call to the administrative console. This allows cluster deployments to receive configuration changes without accessing the administrative console manually (*Administrator's Manual: Web Service Interfaces*).

- The SAML 2 Attribute Query Profile is supported by PingFederate. This allows SPs to request user attributes from an IdP independent of user authentication (*Administrator's Manual: Managing SP Connections and Managing IdP Connections*).
- Multi-valued attributes passed in an Assertion to a WS-Federation partner conform to how ADFS expects them.
- SAML metadata may be generated with a digital signature to guarantee authenticity (*Administrator's Manual: System Administration*).
- The Protocol Endpoints popup contains online help links. These links may be used to learn more about the server's endpoints from a partner perspective.
- The User-Session Creation screen in the IdP connection flow contains summary information that provides administrators with insight into the current configuration. Similarly, the Assertion Creation screen in the SP connection flow also provides administrators with useful configuration information (*Administrator's Manual: Managing SP Connections and Managing IdP Connections*).
- Administrators can specify a descriptive "Connection Name" for partner connections (*Administrator's Manual: General Information and General Connection Information*).
- The "Web SSO" portion of partner configuration is distinct from first/last-mile configuration (*Administrator's Manual: Managing SP Connections and Managing IdP Connections*).
- Connection summary screens contain +/- buttons to show/hide major sections.
- Metadata import extracts the Base URL from the metadata file and populates relative URLs within the connection (*Administrator's Manual: Importing Metadata and Importing IdP Metadata*).
- PingFederate communicates with an SNMP network-management console using standard SNMP Get and Trap operations (*Administrator's Manual: Configuring Runtime Reporting*).
- The PingFederate engine exposes a URL designed for load balancers to determine whether a PingFederate server is available to process transactions (*Administrator's Manual: Application Endpoints*).
- Certificate-management usability is improved (*Administrator's Manual: Security Management*).
- Certificate expirations are tracked by PingFederate, and impending expirations may result in a notification sent via email, when configured (*Administrator's Manual: Configuring Runtime Notifications*).
- New, more user-friendly sample applications focus on demonstrating PingFederate server functionality (*Quick-Start Guide*).
- The entry screen into the "Credentials" area of connections contains useful information about the credentials used (*Administrator's Manual: Identity Provider SSO Configuration and Service Provider SSO Configuration*).
- The server ID is no longer displayed to the administrator.
- A cluster's administrative console no longer aggregates transactions counts.
- The "Cluster Management" link replaces "High Availability" on the Main Menu (*Server Clustering Guide*).
- Clustering supports TCP and UDP, node authentication, optional encryption, and use of a single port for all communication (*Server Clustering Guide*).

- CRL processing updated to support the U.S. GSA's E-Authentication v2 specification.
- The "About" pop-up contains additional license-key information.

PingFederate 4.4.2 – October 2007

Mitigated a number of potential security vulnerabilities regarding XML document processing.

PingFederate 4.4.1 – June 2007

Addresses user-interface defects related to attribute query, XML encryption, and LDAP data store lookups.

PingFederate 4.4 – May 2007

- Removal of support for the U.S. GSA's E-Authentication v1.0 specification.
- Addition for support of signed metadata files.
- Support for partner certificate revocation through CRLs.
- Increased flexibility around encryption of Name ID in SAML v2.0 SLO requests when the Name ID is encrypted within an assertion.
- Support for the SOAP binding for both inbound and outbound SAML v2.0 messages.
- Improved support for deployments where the server contains multiple network interfaces.
- Usability enhancements to the Main Menu layout and Local Settings flow.
- More sophisticated attribute-fulfillment operations through support of a Java-like syntax for data manipulation.
- Removal of extraneous credentials settings for WS-Federation and SAML v1.x connections.
- Improved display of long connection IDs on the Main Menu.
- Inclusion of a demo application that complements the existing sample applications as described in the Quick-Start Guide.

PingFederate 4.3 – March 2007

- Virtual Server Identities allow PingFederate to use distinct protocol identifiers in the context of a particular partner connection.
- Additional customizable end-user error pages for 'page expired' and general unexpected error conditions.
- Increased flexibility by allowing for a list of additional valid hostnames to be used for incoming protocol message validation.
- Optionally, the SSO Directory Web Services can be protected with HTTP basic authentication.
- New administrative console error page.
- Improved short-term state management memory utilization for improved system resiliency.

- Improved input-data validation and character-entity encoding of data when displayed--for protection against cross-site scripting attacks.
- An IdP connection configured to use only a single SP Adapter Instance will ignore the URL-to-Adapter mapping step at runtime and just use the given adapter.
- Blocked directory indexing to limit browsing of static web content.
- Disabled unnecessary JRMP JMX port usage.
- Mitigated HTTP response splitting attacks by disallowing potentially dangerous characters in all redirects.

PingFederate 4.2 – December 2006

- Enhanced transaction logging functionality.
- Sensitive user attribute values can be masked in log files to enhance privacy considerations.
- The administrative console runs on a distinct port from the runtime engine allowing for more flexible and secure deployment options.
- New filtering functionality on connection management screens enables easier management of large numbers of federation partners.
- Adapter SDK enhancements to facilitate file downloads.
- Usability refinements on X.509 certificate summary screens.
- Less verbose description of certificates in drop down boxes improve look and feel.
- Multiple partner endpoints of the same type can be configured to use the same binding.
- Improved support for reverse proxy deployments.

PingFederate 4.1 – October 2006

- Liberty Alliance interoperability certified.
- SAML2 x509 Attribute Sharing Profile (XASP).
- Optional Hardware Security Module (HSM) mode, that enables storage of private keys and crypto processing on an external HSM unit that is FIPS-140-2 certified.
- Updated Protocol Configuration Wizard. Updated the flow and number of steps required to onboard a connection partner.
- Error handling templates that can be used to build SSO/SLO landing pages that communicate error status and support instructions to users.
- Configuration options that enable multiple, simultaneous authentication profiles for the SOAP back-channel. These include HTTP Basic, SSL Client Certificates, and Digital Signatures.
- Digital signature capability for client authentication when using SAML 1.x.
- Pop-up server endpoint display that filters by role and configurations made.

- Two digital signature verification certificates can be assigned to a connection, allowing the partner flexibility in selecting one certificate or the other. When one certificate expires, the other certificate is used without the need for close synchronization.
- A `run.properties` configuration that allows an admin to specify an alternate port with which to communicate over the back-channel to partner's SAML gateway.
- Support for 32-and 64- bit machine architectures. See data sheet for specific platforms.

PingFederate 4.0 – June 2006

- Deploy multiple adapters as an IdP to look up different session security contexts across security domains and applications.
- Save a partially completed connection as a draft.
- Copy a connection to rapidly set up other partners or test environments with similar configurations.
- Attribute source SDK enables retrieval of attributes from additional data source interfaces such as SOAP, flat files, or custom interfaces.
- Multi-administrator support. Select from default roles: User Admin, Admin, Auditor, and Crypto Admin.
- Ability to edit SP adapters that are in-use with target systems.
- Encrypt or decrypt entire assertions or select elements. This is of particular value when intermediaries may handle SAML traffic.
- Generate unique, Transient Name Ids each time the user federates to protect their identity.
- SAML 2-compliant IdP Discovery mechanism that enables an SP to dynamically determine the appropriate IdP for the user.
- Integration Kits provide additional methods that streamline passing of authentication context from an IdP to an SP.
- Single log-out across all connections and protocols that support SLO.
- Using an affiliate id, an SP can instruct an IdP to re-use the same persistent name identifier that was already used at other applications within the portal.
- Non-normative support for SP-initiated SSO with SAML 1.x protocols.

PingFederate 3.0.2 - February 2006

Upgrade of Jetty component to v5.1.10 in response to a security warning from the National Vulnerability Database.

PingFederate 3.0.1 - December 2005

- Complete clustering support.
- Optional email notification on licensing issues.
- You can edit a previously configured connection (either IdP or SP) that uses a data store that is unavailable.

PingFederate 3.0 – November 2005

- Support for SAML 2.0.
- Use-case wizard for partner connection configurations.
- Support for multiple security domains.
- Redesigned user interface.
- Embedded clustering.
- Fixes for LDAP and JDBC connectivity.

PingFederate 2.1 – July 2005

- Patched a concurrency bug in the XML security library.
- Patched a memory leak in the XML-to-object binding library.
- Removed the core protocol processor's reliance on a workflow engine to resolve a memory leak and improve overall performance.
- Fixed a subtle memory leak in the module that tracks assertions in order to prevent replay in the POST profile.
- Updated the default server SSL certificate (extended the expiration date).

PingFederate 2.0 – February 2005

Initial release.
